## Save Your Face Shields and Gun!

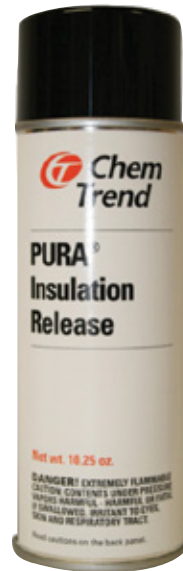

Do you constantly go through face shields on your respirators? Does your spray gun get matted with layers of spray foam? Would you like to keep a good spray pattern longer?

If the answer is yes to these questions then you need to find a can of Pura<sup>®</sup> Insulation Release.

Pura Insulation Release is the pre-spray before you spray anything else. Liberally apply to the protective face shield for your respirator before you put it on your mask and spray, as the mist builds up, you can easily wipe away the build up and continue to spray. Spray it on your gun before you start spraying – at the end of the day you will be able to easily remove any SPF build up. And, if you spray it down into your mix chamber before you spray, your spray pattern will last longer.

Pura Insulation Release literally keeps SPF from sticking and saves you the time you would otherwise spend changing out protective face shields on your mask and drilling out your mix chamber. Pura Insulation Release is a proven product in our industry and should be on hand in your spray rig. 

### Having trouble with foam? Just pick up the phone!
